Transcranial alternating current stimulation reveals atypical 40 Hz phosphene thresholds in synaesthesia. None of the participants reported photisms that were spatially localized between the stimulus and the perceiver Ward et al. Although they should be interpreted with caution given The Phosphene Chronicles sample sizes, these differences expand upon research showing that spatial attention transiently enhances excitability in primary visual cortex Bestmann et al. ThePhospheneChroniclesNov Second, following previous studies that used questionnaires to provide a continuous measure of individual differences among synesthetes Rouw and Scholte ; Skelton et al. Help us improve our Author Pages by updating your bibliography and submitting a new or current image and bio. However, as synesthetes age, persistent concurrent activation of downstream regions, including the fusiform gyrus, V4, and parietal cortex, may lead to insufficient pruning during infancy and thus increased connectivity, which may then play a The Phosphene Chronicles role in the maintenance of synesthesia and its phenomenology van Leeuwen et al.
